< □ > < □ > < □ > < □ > < □ > < □ >

Project context

Hazel live programming environment An experimental editor with typed holes aimed at solving the "gap problem," developed at UM Functional programming Context for PL theory Implementation-based Mostly practically-driven

Project goal

Improve aspects of Hazel evaluation Mostly performance-related

< □ > < 同 > < 回 > < 回 > < 回 >

Project scope

Evaluation with environments Lazy variable lookup for performance Hole instances to hole closures Redefining hole instances for performance Implementing fill-and-resume (FAR) Efficiently resume evaluation

Project evaluation

Empirical evaluation Measure performance gain of motivating cases Informal metatheory State metatheorems and provide proof sketches

# The FAR process

Check if a fill is appropriate. If so, then:

- Detect fill parameters (u, d)
- 2 "Fill": substitute d for every instance of u
- ③ "Resume": resume evaluation

If not, evaluate as usual.

### Innovations of this work

Generalized closures Useful for evaluation and memoization Unique hole closures Grouping hole instances by environment FAR as a generalization of evaluation Each edit is a *n*-step FAR

(日) (四) (日) (日) (日)

# Metatheory

- Invariants of the evaluation steps; informally justified
- Preservation
- Evaluation boundary
- Singular evaluation boundary
- Substitution postprocessing closures
- Evaluation with environments correctness
- Hole numbering postprocessing
- Fill operation
- Resume operation

#### Future work

Fully automatic FAR Integrate FAR into the Hazel MVC model *n*-step FAR Integrate edit history into FAR
Formal evaluation of metatheory Check coverage and correctness of metatheorems using Agda
User editing studies Gather data on "true" performance impact

イロト イポト イヨト イヨト

### Conclusions

Evaluation with environments Expected performance gains, implementation remains functionally pure
Generalized closures Simplify many parts of the implementation, also useful for FAR
Memoization of environments Applicable for postprocessing, equality checking, resume operation
FAR PoC Including *n*-step detection, re-evaluation of closures
Plausible metatheory For future work in Agda
